

James Latham now offering KYDEX

James Latham is now the exclusive UK distributor of KYDEX sheet, the exceptionally durable thermoplastic sheet that will enhance virtually any commercial, retail or educational styling theme.

Supplied in a wide range of colours, textures and patterns, KYDEX thermoplastic sheets offer designers the ability to create an almost unlimited variety of flat and three-dimensional effects which can be achieved through techniques including; thermoforming, membrane pressing, post forming, brake forming, laminating and machining. This allows different parts to be produced using the most efficient technique yet still match in appearance.

KYDEX sheet can be formed to compound corners and contoured edges, minimising the need for moulding and edge banding and enabling large area installations to have the appearance of one seamless, single application. Even brand logos and messages can be embossed into the material.

Offering unrivalled, long term performance from its exceptional impact, chemical and scratch resistance, KYDEX will not chip, crack, break, or snap, making it the perfect surface solution for demanding, high traffic or high impact applications in sectors such as retail, aviation, mass transit, marine and industrial.

The KYDEX thermoplastics range will be distributed on a national basis by James Latham's wholly owned specialist panel company, Advanced Technical Panels (ATP) which already has expertise in a number of these sectors.

KYDEX sheet is available in over 3500 colours, including granite, metallic and wood grain patterns as well as multiple surface textures and thicknesses from 0.71mm to 12mm. And if none of these choices meet your needs, we'll make a custom colour just for you.
